FGD Rule Relaxation to Reduce Electricity Cost by 25-30p a Unit

PTI

New Delhi: The government's move to ease sulphur emission rules for most coal-fired power plants strikes a delicate balance between costs, climate and compliance and is expected to cut electricity costs by 25-30 paise per unit, officials said on Sunday.

In a gazette notification, the government has restricted the 2015 mandate of installing flue-gas desulphurisation (FGD) systems that remove sulphur from a power plants' exhaust gases, only to plants located within 10 kilometres of cities with a population exceeding one million.

Plants in critically polluted areas or non-attainment cities will be evaluated on a case-by-case basis while all other plants – accounting for nearly 79 per cent of India's thermal power capacity – are exempt from mandatory FGD installation.

The notification stated that the decision was made following a detailed analysis by the Central Pollution Control Board, which found increased carbon dioxide emissions resulting from the operation

of existing control measures.

Industry officials said this would lead to differentiated compliance based on proximity to urban populations and the sulphur content of the coal used.

The new framework has been finalised after extensive deliberations and multiple independent studies. The decision follows a series of studies by IIT Delhi, CSIR-NEERI and the National Institute of Advanced Studies (NIAS), which found that ambient sulphur dioxide levels in most parts of India are well within the National Ambient Air Quality Standards (NAAQS).

Measurements across multiple cities showed sulphur oxide levels ranging between 3 and 20 micrograms per cubic meter, significantly below the NAAQS threshold of 80 micrograms per cubic meter.

Officials said studies had also questioned the environmental and economic efficacy of a universal FGD mandate in the Indian context.

Indian coal typically has a sulphur content of less than 0.5 per cent, and due to high stack heights and favourable meteorological conditions, dispersion of SO2 is efficient.

The NIAS study warned that retrofitting FGDs nationwide would add an estimated 69 million tonnes of CO2 emissions between 2025 and 2030 due to increased limestone mining, transportation, and power consumption.

Industry officials said the relaxed norms are expected to bring down the cost of electricity by 25-30 paise per unit. That benefit, they said, will ultimately flow to consumers.

SO2 Emission Norms for Coal Power Plants Eased

Our Bureau

New Delhi: India has eased the requirement for coal-fired power plants to reduce sulphur dioxide concentrations emitted by them.

This does away with the mandate on all coal-fired power plants to install flue gas desulphurisation systems

The new norms from the environment ministry do not require plants other than those within 10 km radius of National Capital Region or cities having million plus population to meet the standards for sulphur dioxide emissions and install flue gas desulphurisation (FGD) systems. Such plants are required to comply with the norms by 2027.

For upcoming plants in polluted areas, the applicability of sulphur dioxide emission standards, will be decided on a case-to-case basis by the government, a gazette notification from the environment ministry late on Friday.

An order from the government in 2015 mandated all coal-based plants to follow

Sulphur dioxide emission standards which required installing FGD systems.

According to a government report in February this year, 537 units totalling 204 GW were identified for installation of FGDs in thermal plants. Of them, installation were completed in 49 units, while contracts were awarded or were under implementation in 211 units, and 180 Units were under various stages of tendering process.

The move gains significance as coalbased plants comprise slightly over 50% of India's installed capacity at 242 GW. The capacity is expected to rise with 97 GW additional capacity targeted by FY32.

PRESS TRUST OF INDIA New Delhi, 13 July

The government's move to ease sulphur emission rules for most coal-fired power plants strikes a delicate balance between costs, climate and compliance and is expected to cut electricity costs by 25-30 paise per unit, officials said on Sunday.

In a gazette notification, the government has restricted the 2015 mandate of installing flue-gas desulfurization (FGD) systems that remove sulphur from a power plants' exhaust gases, only to plants located within 10 kilometres of cities with a population ex-

ceeding one million. Plants in critically polluted areas or non-attainment cities will be WOULD NOT ONLY evaluated on a case-bycase basis while all other plants - accounting for nearly 79 per cent of India's thermal power capacity are exempt from manda-

tory FGD installation.

The notification stated that the decision was made following a detailed analysis by the Central Pollution Control Board, which found increased carbon dioxide emissions resulting from the operation of existing control measures.

Industry officials said this would lead to differentiated compliance based on proximity to urban populations and the sulphur content of the coal used.

The new framework has been finalised after extensive deliberations and multiple independent studies. The decision follows a series of studies by IIT Delhi, CSIR-NEERI and the National Institute of Advanced Studies (NIAS), which found that ambient sulphur di-

oxide levels in most parts of India are well within the National Ambient Air Quality Standards (NAAQS).

Measurements across multiple cities showed sulphur oxide levels ranging between 3 and 20 micrograms per cubic metre, significantly below the NAAQS threshold of 80 micrograms per cubic metre.

Officials said studies had also questioned the environmental and economic efficacy of a universal FGD mandate in the Indian context.

Indian coal typically has a sulphur content of less than 0.5 per cent, and due to high stack heights and favourable

meteorological conditions, dispersion of SO2 is efficient.

The NIAS study warned that retrofitting FGDs nationwide would add an estimated 69 million tonnes of CO2 emissions between 2025 and 2030 due to increased limestone mining, transportation, and power

consumption.

Industry officials said the relaxed norms are expected to bring down the cost of electricity by 25-30 paise per unit. That benefit, they said, will ultimately flow to consumers.

In a high-demand, cost-sensitive economy, the impact could be significant - helping state discoms contain tariffs and reducing the subsidy burden on governments.

The financial burden of mandatory FGD retrofitting was previously estimated at over ₹2.5 trillion, or ₹1.2 crore per Mw, with installation timelines of up to 45 days per unit. Several power producers had warned that this would not only raise costs but also jeopardise grid stability during peak seasons.

Power costs may decline as emissions norm eased

Rituraj Baruah

rituraj baruah@livemint.com NEW DELHI

The government has relaxed the universal implementation of fluegas desulphurization (FGD) systems at coal power plants across the country, in a move that is likely to lower electricity prices.

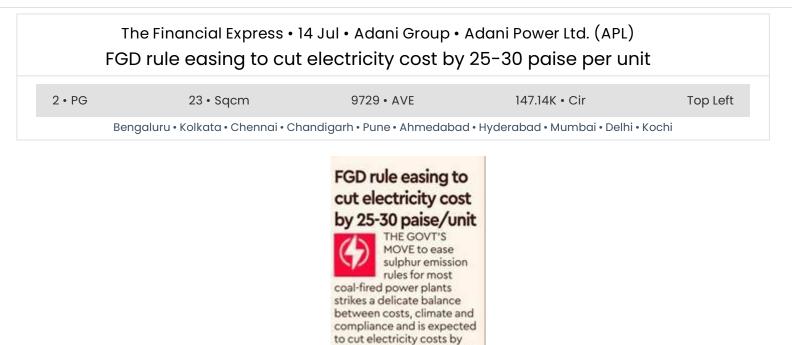

A 12 July-notification from the Union ministry of environment, forest and climate change (MoEF&CC) said thermal power plants outside a 10km radius of cities with a population of 1 million or more will be excluded from the requirement to install the system.

Flue gas, a residue from thermal power plants, emits sulphur dioxide (SO2), which can mix in the atmosphere and create secondary particulate matter, an air pollutant.

While plants in the National Capital Region (NCR) and other cities with at least 1 million population will have to comply with the norm, for those within 10km radius of critically polluted areas or nonattainment cities, the need for FGD installation will be decided on a case-by-case basis.

Plants exempted from the requirement to install FGD systems account for nearly 79% of the overall 180 operational power plants in the country.

New Delhi, July 12

INDIA HAS REVERSED a decade-old mandate to install \$30 billion worth of clean-air equipment, easing sulphur emission rules for most coalfired power plants, a government order said.

reported the government was reviewing 2015 norms that required nearly 540 coal-based power units to install flue-gas desulphurisation (FGD) systems that remove sulphur from the plants' exhaust gases in phases starting in 2027.

The environment ministry late on Friday issued a gazette cities, from the 2015 mandate.

taken on a "case-to-case basis",

the notification said.

The balance of 10% of the coal-fired power plants closer to New Delhi and other cities with a million-plus population will be required to install the desulphurisation equipment by December 2027, according to the new mandate.

The notification comes after state-run NTPC, India's top electricity producer, spent about \$4 billion on installing the equipment at about 11% of the power plants, and about 50% of the units either placed orders for the desulphurisation systems or are installing them.

The Friday notification did not mention the impact on the competitiveness or recovery of costs by these power plants.

It said the decision was taken after the Central Pollution Control Board carried out a detailed analysis of the increase in "carbon dioxide emission into the atmosphere due to operation of control measures being deployed".

Reuters in December

REUTERS

CAPITAL IDEAS.

he dictum "No-one-size-fits-all" is true in the energy and environment space, and after much arguments, the policy makers seem to have

RICHA MISHRA

acknowledged it. On July 11, the Ministry of Environment, Forest and Climate Change (MoEFCC) came out with a notification which eased sulphur emission rules for most coal-fired power plants. This move is expected to cut electricity costs by 25-30 paise per unit.

The sulphur dioxide emission standards were brought out by the Ministry on December 7, 2015, for coal and lignite based thermal power plants. It also prescribed certain timelines, which were amended from time to time.

Flue Gas Desulfurisation (FGD) is a process used to remove SO2 from the flue gas produced when burning fossil fuels such as coal or oil or natural gas. Since April last year, debates and discussions have been taking place between the Ministries of Environment and Power over the relevance of FGDs to control sulphur dioxide emissions from

coal-fired thermal power plants. Section 7 of the Electricity Act 2003 prescribes that any generating company can establish, operate and maintain a generating station without obtaining a licence under the Act, if it complies with the technical standards relating to connectivity with the grid referred to in clause (b) of Section 73 of the Act.

However, all thermal power plants are required to comply with the emission

norms as notified by the Environment Ministry and the directions given by CPCB from time to time.

The Environment Ministry notification of December 2015, which was last amended in December 2024 stipulated stack emission norms (including for Particulate Matter (PM) and Sulphur Di-oxide(SO2)) based on the age of the plant, timelines for compliance based on the categorisation of these TPPs based on location, and Environmental Compensation, in case of non-compliance.

The government has split the thermal power plants into three different categories:

Categories: Category A: Within 10 km radius of National Capital Region or cities having million plus population; Category B: Within 10 km radius of Critically Polluted Areas declared by CPCB2 or Non-attainment cities under the National Clean Air Decement. the National Clean Air Program;

Category C: Other than those included in category A and B.

CALL FOR EASING NORMS In its latest notification, the

Environment Ministry has said that it received many representations regarding exemption or relaxation in timelines of these emission standards due to limited availability of technology

Several studies were conducted by research institutions regarding effectiveness and rationale behind these standards and their role in overall ambient air pollution of the region

providers, its techno-economic feasibility, negative impact of Covid pandemic on supply chain, price escalation due to high demand and low supplies, low sulphur dioxide concentration in ambient air and the heavy burden on consumer due to increase in electricity tariffs, etc.

It also said that explicit recommendation of the Power Ministry was received in this regard.

The Environment Ministry also noted that several studies were conducted by research institutions regarding effectiveness and rationale behind these standards and their role in overall ambient air pollution of the region.

A committee in the Central Pollution Control Board was constituted to examine the issue, assess the available study reports, other relevant materials and other related factors and make a recommendation on the applicability of these standards and its timeline, it said.

The three different studies were done by IIT Delhi, CSIR-NEERI and National Institute of Advanced Studies (NIAS) at Bengaluru, respectively. All these studies were conducted independently and were commissioned by different

government departments. The key common point in these three scientific studies is that, fitment of FGDs in all TPPs in India is not necessary to comply with the NAAQ standards whose compliance is directly related to public health.

REMOVING UNCERTAINTY

Clearly, the Ministry wants to remove the uncertainty over FGDs in the minds of the industry without causing any harm to public health. On the other hand, the Ministry has not made any change in the stack emission standards for PM pollution since it is the key

concern for public health. Further, the Ministry has also mandated that all plants in Category A must comply with the SO2 emission standards by December 31, 2027 while plants in Category B must comply by December 31, 2028 unless they are granted specific exemption by the Ministry.

According to R Srikanth, Professor & Dean of School of Natural Sciences 8 Engineering, National Institute of Advanced Studies, Bengaluru, and co-author of the NIAS study, "Indigenous High-efficiency Electrostatic Precipitators (ESPs) have been successfully retrofitted even in thermal power plants with space constraints and have demonstrated their capability to achieve the above stack emission standards for PM.

"Therefore, PM pollution control in plants must be prioritised by retrofitting High-efficiency ESPs in all 537 existing thermal power plants to comply with the PM stack emission norms within the next two years.

On the other hand, the installation of FGDs indiscriminately in 537 existing plants has a significant impact on global warming by removing coolant sulphate aerosols which mask global warming (as per the Sixth Assessment Report of the Intergovernmental Panel on Climate Change issued in 2021) beside Change issued in 2021) besides increasing freshwater consumption in inland plants. This will impact our climate commitments and reduce water security while imposing significant capital investments leading to tariff hikes for electricity customers.

Critics say the earlier decision was a hurried one. A lesson from this is that before in policy decision is taken, there is a need to have proper scientific studies covering various parts of the country followed by stakeholder consultation.

CENTRE RELAXES FGD RULE, ELECTRICITY COST TO REDUCE BY 25-30 PAISE A UNIT

NEW DELHI

The government's move to ease sulphur emission rules for most coal-fired power plants strikes a delicate balance between costs, climate and compliance and is expected to cut electricity costs by 25-30 paise per unit, officials said on Sunday.

In a gazette notification, the government has restricted the 2015 mandate of installing flue-gas desulphurisation (FGD) systems that remove sulphur from a power plants' exhaust gases, only to plants located within 10 kilometres of cities with a population exceeding one million.

Plants in critically polluted areas or non-attainment cities will be evaluated on a case-by-case basis while all other plants -- accounting for nearly 79 per cent of India's thermal power capacity -- are exempt from mandatory FGD installation.

The notification stated that the decision was made following a detailed analysis by the Central Pollution

Control Board, which found increased carbon dioxide emissions resulting from the operation of existing control measures.

Industry officials said this would lead to differentiated compliance based on proximity to urban populations and the sulphur content of the coal used.

The new framework has been finalised after extensive deliberations and multiple independent studies. The decision follows a series of studies by IIT Delhi, CSIR-NEERI and the National Institute of Advanced Studies (NIAS), which found that ambient sulphur dioxide levels in most parts of India are well within the National Ambient Air Quality Standards (NAAQS).

Measurements across multiple cities showed sulphur oxide levels ranging between 3 and 20 micrograms per cubic meter, significantly below the NAAQS threshold of 80 micrograms per cubic meter. Officials said studies had also questioned the environmental and economic efficacy of a universal FGD mandate in the Indian context. Indian coal typically has a sulphur content of less than 0.5 per cent, and due to high stack heights and favourable meteorological conditions, dispersion of SO2 is efficient.

The NIAS study warned that retrofitting FGDs nationwide would add an estimated 69 million tonnes of CO2 emissions between 2025 and 2030 due to increased limestone mining, transportation, and power consumption.

Industry officials said the relaxed norms are expected to bring down the cost of electricity by 25-30 paise per unit. That benefit, they said, will ultimately flow to consumers.

In a high-demand, costsensitive economy, the impact could be significant -- helping state discoms contain tariffs and reducing the subsidy burden on governments. The financial burden of mandatory FGD retrofitting was previously estimated at over Rs 2.5 lakh crore, or Rs 1.2 crore per MW, with installation timelines of up to 45 days per unit. Several power producers had warned that this would not only raise costs but also jeopardise grid stability during peak seasons.

Industry executives welcomed the decision. "This is a rational, science-based move that avoids unnecessary costs and focuses regulation where it is most needed," said a senior executive at a leading public sector utility. "More importantly, it will help keep electricity affordable."

Officials stressed that the government remains committed to environmental protection, but with a smarter lens. "This is not a rollback. It is a recalibration based on evidence," said a senior government official. "Our approach is now targeted, efficient and climateconscious."

An affidavit incorporating these findings will be submitted shortly to the Supreme Court in the MC Mehta vs Union of India case, where FGD enforcement timelines have been under judicial scrutiny.

ICP Keshari, Director General of Power Producers Association (PPA), hailed the decision as "good and consumer-centric".

The move will benefit power plants based on domestic coal, he said. Indian coal, he said, does not have any big sulfur oxides (SOx) emission problem and it is only the particulate matter, which is of concern.

Delhi 2nd most polluted city this yr, has breached annual safety norms already

TIMES NEWS NETWORK

New Delhi: Delhi, which ranked as India's second most polluted city with PM2.5 levels averaging 87 micrograms per cubic metre in the first half of 2025, crossed the WHO annual PM2.5 limit as early as Jan 10, and surpassed the National Ambient Air Quality Standard (NAAQS) by June 5.

Due to this, Delhi will remain in violation of both standards for the remainder of the year, regardless of subsequent pollution trends, says a new report by the Centre for Research on Energy and Clean Air (CREA).

The "overshoot day" is defined as a day when the average pollution levels preceding that

day are so high that even a 0.1 g/m² daily concentration of the pollutant for the remaining days of the year would ensure non-compliance of the city to the prescribed annual standard or guideline. CREA, which analysed air quality across India for Jan to June stated that by June, 259 out of 293 cities (over 88%) had already overshot the WHO's annual PM2.5 standard, indicating that non-compliance is widespread and not limited to a few hotspots

The analysis identifies Byrnihat, on the Assam-Meghalaya border, as the most polluted city in the country during the first half of 2025, with an average PM2.5 concentration of Delhi will remain in violation of both standards for the remainder of the year, regardless of pollution trends, says CREA's report

133 micrograms per cubic metre. Delhi ranked second as the most polluted city with PM2.5 levels at 87 micrograms per cubic metre. "Delhi air pollution is not just from vehicles or seasonal biomass burning, but also from year-round emissions across sectors. Yet, enforcement remains uneven. For example, despite Supreme Court directives, most thermal power plants near Delhi still lack Flue Gas Desulfurization (FGD) systems. As of mid-2025, only two of eleven plants within 300 km have operational FGDs. Such enforcement gaps undermine vehicle policy gains and leave major sources largely unchecked," said Manoj Kumar, analyst at CREA.

In terms of average PM2.5, most days in Delhi were in the moderate category (63), followed by the satisfactory category (52), poor category (31), very poor category (29), and both severe and good categories on three days each. Other cities in the top 10 most polluted list include Hajipur, Ghaziabad, Gurgaon, Sasaram, Patna, Talcher, Rourkela, and Rajgir. Hindustan Times • 15 Jul • Adani Group • Adani Power Ltd. Ministry supports revised SO₂ emission norms, slams critics

Jayashree Nandi

letters@hindustantimes.com

NEW DELHI: The government on Monday defended its recent move to ease sulphur dioxide (SO₂) emission norms for thermal power plants, saying the decision was based on detailed scientific studies and stakeholder consultations, and that media reports terming the move a "regulatory dilution" have "grossly misinterpreted" the notification.

The statement came days after the Union environment ministry on July II extended deadlines and exempted a large number of coal plants from installing flue gas desulphurisation units.

"The media reports misrepresent both the scientific evidence and the environmental policy rationale underlying the revised notification," the ministry said in its statement on Monday.

It said the revised norms were framed after "extensive consultations with stakeholders and research institutions regarding the effectiveness and rationale behind stack emission standards for SO2 on 537 TPPs throughout the country, and its role in overall ambient air pollution of the region."

Further, the ministry said sulfate aerosols from SO2 constitute a relatively small fraction of PM 2.5, suggesting that was not a major public health issue, as suggested by environmental groups.

Responding to criticism over the rollback of deadlines and THE MINISTRY ALSO REJECTED SUGGESTIONS THAT NAAQS FOR SO2, LAST REVISED IN 2009, ARE OUTDATED

exemptions for Category C plants, which make up the bulk of India's coal fleet, the ministry said, "The media reports misrepresent both the scientific evidence and the environmental policy rationale underlying the revised notification. Contrary to claims of regulatory dilution, the ministry's decision represents a rational, evidence-based recalibration anchored in current ambient air quality data, sectoral emission trends and broader sustainability imperatives."

The ministry also rejected suggestions that the National Ambient Air Quality Standards (NAAQS) for SO2, last revised in 2009, are outdated.

India established stringent sulphur dioxide emission standards for coal-based power plants in December 2015, requiring compliance within two years.

Even after four extensions, most of coal-fired power plants have not yet installed flue gas desulphurisation units to control SO2 emissions, a major air pollutant that converts into fine particulate matter (PM2.5) and causes a range of diseases.

Emissions that lead to high concentrations of SO2 generally also lead to the formation of other SOx. The largest sources of SO2 emissions are from fossil fuel combustion at power plants and other industrial facilities, EPA has said.

Following the July II notification, Shiv Sena (UBT) leader Aaditya Thackeray reached out to Union environment minister Bhupender Yadav and said that the notification has diluted the existing norms.

"The notification dilutes the 2015 notification issued by the government to install flue gas desulphurization (FGD) units for all coal plants. I am sure you are aware that FGD units are critical because they remove sulphur dioxide from the air — a major pollutant and a health hazard. Installing FGD units can help avoid up to 48,000 deaths annually in India," the Shiv Sena (UBT) leader said in his letter.

Meeting SO2 norms requires the installation of Flue Gas Desulphurisation (FGD) systems, which remove sulphur compounds from fossil fuel emissions.

"...repeated delays in implementing emission standards for coal-based power plants since 2017 have hindered progress toward cleaner air. Exempting category C plants from SO2 controls will severely undermine efforts to achieve clean air across the country, "said Envirocatalysts founder and lead analyst Sunil Dahiya.

Hindustan Times • 14 Jul • Adani Power Ltd. (APL) POWER COSTS MAY DECLINE AS CENTRE EASES EMISSION NORMS 9 • PG 89 · Sqcm 138091 • AVE 267.13K • Cir Top Right Chandigarh POWER COSTS MAY DECLINE AS CENTRE EASES EMISSION NORMS Rituraj Baruah rituraj.baruah@livemint.com NEW DELHI: The government has relaxed the universal implementation of flue-gas desulphurisation (FGD) systems at coal power plants across the country, in a move that is likely to lower electricity prices. A 12 July-notification from the Union ministry of environment, forest and climate change (MoEF&CC) said thermal power plants outside a 10km radius of cities with a population of I million or more will be excluded from the requirement to install the system. Flue gas, a residue from thermal power plants, emits sulphur dioxide (SO2), which can mix in the atmosphere and create secondary particulate matter, an air pollutant. While plants in the National Capital Region (NCR) and other cities with at least I million population will have to comply with the norm, for those within 10km radius of critically polluted areas or non-attainment cities, the need for FGD installation will be decided on a caseby-case basis by the Centre based on recommendations of the expert appraisal committee in charge of thermal power projects. "The sulphur dioxide emis-sion standards shall not be applicable to all Category C thermal power plants subject to ensuring compliance of stack height criteria notified vide notification number GSR 742 (E), dated the 30th August, 1990," said the notification referring to the plants outside the radius of 10km of cities with 1 million population. These plants, which are exempted from the requirement to install FGD systems, account for nearly 79% of the overall 180 operational power plants in the country. Plants within a lokm radius of the NCR or cities with a population of 1 million initially had to install FGD systems by 2017 but have been given multiple extensions. Now, they need to comply by 2027-end.

Environment Ministry defends revised framework for thermal plants to meet SO2 emission norms

EXPRESS NEWS SERVICE NEW DELHI, JULY 14

THE UNION Environment Ministry Monday defended its July 11 order which introduced a revised framework for thermal power plants to meet sulphur dioxide (SO2) emission norms and said that contrary to "claims of regulatory dilution", the decision was based on evidence, sectoral emission trends and sustainability imperatives.

The ministry's revised compliance framework exempted a large number of coal- and lignitebased plants from the mandate of retro-fitting plants with flue gas desulphurization devices. The ministry said there was no notable difference in ambient SO2 concentrations between cities where plants had fitted the technology versus those that had not.

SO2 is a harmful gas and is emitted when coal is burned in energy production. It also aids formation of secondary pollutants.

"The norms of Sulphur Dioxide emissions from Thermal Power Plants notified on 11th July is based on extensive consultations with stakeholders and research institutions regarding the effectiveness and rationale behind stack emission standards for SO2 on 537 TPPs throughout the country, and its role in overall ambient air pollution of the region," a ministry statement said.

"Further, the norms were based on detailed scientific studies which were carried out by premier institutions such as IIT Delhi, National Institute of Advanced Studies as well as by the National Environmental Engineering Research Institute_besides scientific examination by the Central Pollution Control Board," it added.

The ministry said: "Current exposure levels provide no credible evidence to suggest that SO2, under prevailing ambient conditions, is a major public health concern. Moreover, sulfate (sic) aerosols formed from SO2 constitute a relatively small fraction of PM (particulate matter) 2.5."

The SO2 emission norms for coal and lignite power plants were first introduced in 2015. Later, the compliance timelines for plants were divided into three categories, based on the location of the plants.

In the July 11 notification, the ministry said the compliance deadline for Category A plants, located within a 10-km radius of the Delhi-NCR or cities with a population of more than one million, remains December 2027.

Category B plants, located within 10 km of critically polluted areas or cities not in compliance with national ambient air quality standards, will be assessed on a case to case basis based on recommendations of an expert appraisal committee. Category C plants, located outside of these two areas, will be completely exempted from meeting the SO2 norms. However, they will have to comply with stack height criteria. The ministry notification said that thermal power plants due to retire before December 2030 shall not be required to meet the SO2 emission norms, provided they submit an undertaking for exemption. A compensation at the rate of Rs 0.40 per unit of electricity generated would be levied if they continue to operate beyond the 2030 timeline.

Out of the 600 units of coal fired power plants, 537 were identified for installation of fluegas desulphurization (FGD) technology, to curb SO2 emissions.

The ministry said in a detailed note as per rough estimates, ₹2.54 lakh crore would be needed for nationwide retrofitting of coalbased capacity with FGD devices to meet SO2 emission norms.

Ministry defends revised framework for SO2 emission norms

EXPRESS NEWS SERVICE NEW DELHI, JULY 14

THE UNION Environment Ministry Monday defended its July 11 order which introduced a revised framework for thermal power plants to meet sulphur dioxide (SO2) emission norms and said that contrary to "claims of regulatory dilution", the decision was based on evidence, sectoral emission trends and sustainability imperatives.

The ministry's revised compliance framework exempted a large number of coal- and lignite-based plants from the mandate of retro-fitting plants with flue gas desulphurization devices. The ministry said that there was no notable difference in ambient SO2 concentrations between cities where plants had fitted the technology versus those that had not.

SO2 is a harmful gas and is emitted when coal is burned in energy production. It also aids formation of secondary pollutants.

"The norms of Sulphur Dioxide emissions from Thermal Power Plants notified on 11th July is based on extensive consultations with stakeholders and research institutions regarding the effectiveness and rationale behind stack emission standards for SO2 on 537 TPPs throughout the country, and its role in overall ambient air pollution of the region," a ministry statement said.

"The norms were based on detailed scientific studies carried out by premier institutions such as IIT Delhi, National Institute of Advanced Studies as well as by the National Environmental Engineering Research Institute (NEERI)_besides scientific examination by the Central Pollution Control Board," it added.

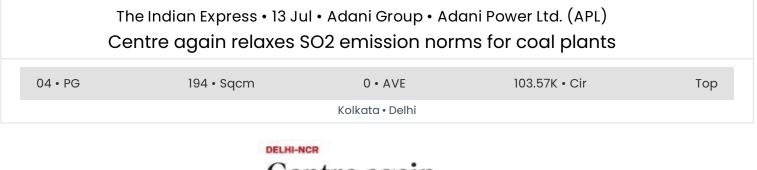

The ministry said: "Current exposure levels provide no credible evidence to suggest that SO2, under prevailing ambient conditions, is a major public health concern. Moreover, sulfate (sic) aerosols formed from SO2 constitute a relatively small fraction of PM (particulate matter) 2.5."

The SO2 emission norms for coal and lignite power plants were first introduced in 2015. Later, the compliance timelines for plants were divided into three categories, based on the location of the plants.

The July 11 order said plants in category A, located within 10 kms of the Delhi-National Capital Region (NCR) or cities with a million plus population have to continue complying with the norms by the end of 2027. For category B plants, within 10-km of critically polluted areas or cities not in compliance with national ambient air quality standards will apply on a case to case basis, based on recommendations of an expert appraisal committee. For Category C plants, outside of these two areas, will be completely exempted from meeting the SO2 norms. However, they will have to comply with stack height criteria.

The notification said that thermal power plants due to retire before December 2030 shall not be required to meet SO2 emission norms, provided they submit an undertaking for exemption.

Centre again relaxes SO2 emission norms for coal plants

NIKHIL GHANEKAR NEW DELHLJULY 1

THE UNION Environment Ministry on Saturday once again relaxed its deadline for coal plants around Delhi-NCR to meet its sulphur emission (SO2) norms introduced in 2015, while completely exempting several plants located in a 10-km radius of critically-polluted areas from meeting these norms.

The order, issued on Saturday, means that of the 600 coal plants that were directed to meet SO2 emissions, only 66 -located within a 10-km radius of Delhi-NCR - will have to comply. The compliance deadline for these plants will be December 31,2027.

The order effectively exempts several coal plants from installing pollution-cutting flue-gas desul-phurisation (FGD) technology, which reduces SO2 emissions from the plant's exhaust gases. The government's latest or-

der is the fifth deadline extension given to plant operators since the norms were notified in 2015.

Sulphur dioxide, a harmful pollutant, also aids formation of particulate matter that is lethal and can enter the bloodstream. These 66 plants, termed as

'Category A' plants, are located within a 10-km radius of Delhi-NCR or cities with over a million opulation as per the 2011 Census.

There are 72 plants in 'Category B' – located within a 10-km radius of critically polluted areas or cities not in com-pliance with national air quality standards - on whom SO2 norms will be applicable on a "case to case" basis, the order said.

Meanwhile, over 450 'Category C' plants, which are neither near Delhi-NCR nor near critically polluted areas, have been completely exempted from meeting the sulphur emission norms,

However, they will have to adhere to the stack height crite-ria and timeline, as prescribed by the Central Pollution Control Board (CPCB), the order added. The order came on the back

of multiple studies, as well as recommendations made by a high-powered committee

chaired by Principal Scientific Adviser (PSA) Aiay Kumar Sood The committee had concluded that the installation of FGD was not necessary in all coal plants. In a report, the National Institute of Advanced Studies

submitted to the high-powered committee that Indian coal, used to generate 92% electricity produced by thermal plants, has a low average sulphur content. In fact, it said that FGD installation in all coal plants by 2030 will increase auxiliary power con-sumption and add more long-lived carbon dioxide emissions, while removing short-lived sul-phur dioxide emissions.

All the studies considered by the office of the PSA had instead called for focussing efforts on cutting particulate matter pollu-tion and installing electrostatic

The order stated that the CPCB had submitted recommendations after detailed analysis and study of national ambi-ent air quality standards of sulphur dioxide across most re-gions. It added that the pollution control measures were causing an increase in carbon dioxide emissions as well increasing footprint due to use of limestone.

of Power about relaxation in tific institutions, and other stake holders regarding these emission standards and their timeline," it added.

The government had identi-fied 537 coal plant units with a capacity of over 200 Gigawatts (GW) for FGD installation. Of these, the technology has al-ready been installed in 49 units with a capacity of 25 GW, as per data provided by the govern-ment in Lok Sabha in March.

Contracts awarded for 211 units (90 GW) and 180 units (58 GW) were under various stages of the tendering process. About 97 units with a capacity of 27 GW were under the pre-tender-ing process, the government had said.

Centre defends new coal plant rules, calls them cost-effective

Jacob Koshy NEW DELHI

The Ministry of Environment and Forests said in a note on Monday that its recent decision to exempt a majority of thermal power plants from installing flue gas desulphurisation (FGD) units was a "scientifically justified shift towards more targeted, cost-effective and climate-coherent regulation" and not a rollback of environmental safeguards.

FGD units are used to cut sulphur dioxide emissions from coal plants and in 2015, the Ministry had made the systems mandatory for all thermal plants. However, only 8% of India's roughly 180 coal plants have done so. The other plants have received multiple extensions from the Ministry for reasons such as limited availability of these units and high cost. The latest order, ho-

Revised norms: Under the new rules, only about 11% of India's 600 thermal power units have to install FGD systems. R.V. MOORTHY

wever, says only a minority of plants – 22% – located in major cities with a history of poor air quality need to install these units.

The revised policy, its note says, reflects India's "...declining ambient sulphur dioxide levels, the limited role of sulphur dioxide levels in driving PM2.5 health impacts and... the disproportionate resource and environmental costs of indiscriminate FGD mandates". The Ministry's note was in response to "media reports".

According to the Ministry, India's annual sulphur dioxide concentration standard of 50 microgram/ cubic metre is more stringent than Japan (66), European Union (52.4) and Australia (66).A 2023 measurement in 492 cities, the Ministry said, found that all but two - Dehradun and Kolar - were compliant. Indian coal was naturally low in sulphur (0.5% of weight) but had high ash content and therefore led to low sulphur dioxide concentrations. Studies had shown that cities with thermal power plants that have FGD technology and those without FGD technology didn't show any "significant difference" in sulphur dioxide concentrations, it said.

"Eliminating all sulphur dioxide emissions would only result in a marginal improvement of particulate matter concentrations... At ₹1.2 crore per MW, the capital expense of installing FGD would be ₹2.54 lakh crore and would only bring about a marginal benefit," it said.

Under new rules, only about 11% of India's 600 thermal power units – a single plant can have multiple units – have to mandatorily install FGD systems.

Smoke and sulphur

There cannot be different environmental standards within India he axe has dropped. The Environment Ministry has exempted the majority of India's coal-fired plants from mandatorily installing Flue Gas Desulphurisation (FGD) systems, which are designed to cut sulphur dioxide (SO2) emissions. In effect, this undermines its own mandate from 2015 that required all such plants - there are about 180 of them now, comprising 600 units - to install these systems. While these were expected to be in place by 2017, only about 8% of the units have actually installed FGD - nearly all by the public-sector National Thermal Power Corporation (NTPC). SO2 is among the gases monitored by the Central Pollution Control Board (CPCB) as exposure beyond a degree can be harmful. Less appreciated is its propensity to form sulphates in the air and contributing to particulate matter pollution. In general, India's average ground-level SO2 measurements have been below the permissible levels - one among several reasons that there has not been a sense of urgency in implementing FGD norms. The official reasons are the limited number of vendors in India, high installation costs, the potential rise in electricity bills, and disruptions due to the COVID-19 pandemic. While the latest deadlines flew by in 2024, the Environment's Ministry's decision - it follows consultations with scientific institutions and new commissioned studies - is a sharp disavowal of the current policy. An expert appraisal committee says that Indian coal is low in sulphur; SO2 levels in cities near plants with operational FGD units do not differ significantly from those without these units, and all of these were anyway well below permissible levels. The committee had said that concerns about sulphates are unfounded. It also argued, echoed by the Minister for Power, that sulphates had a beneficial side-effect in suppressing warming from greenhouse gas emissions. Thus, reducing sulphates would actually worsen warming and compromise India's climate goals. While IPCC assessments do account for the heat-suppressing action of sulphates, nowhere is it projected as an unalloyed good.

A minority of plants, about a fifth – those within a 10 km radius of the NCR; in cities with a population of over a million, or known to be in pollution hotspots – must install FGDs by 2028. This seems to suggest that what determines their installation is the location of a coal plant and not whether FGDs are effective or SO₂ is harmful. This is a rare instance when there are different environmental standards within India on controlling exposure to a pollutant. While it is not unscientific to revise understanding of the harms or benefits of substances, this needs debate in the public domain before a policy is changed. Otherwise it amounts to undermining India's commitment to scientifically informed public health.

Centre relaxes pollution control norm for thermal power plants

Jacob Koshy NEW DELHI

The Union Environment Ministry has exempted the majority of India's thermal power plants from installing flue gas desulphurisation systems, which are designed to cut sulphur dioxide emissions. Flue gas, a residue from burning fuels in thermal power plants, emits SO2, which can mix in the atmosphere and create secondary particulate matter linked to air pollution. There are about 180 TPPs in India and a single plant can have multiple units. 78% of thermal plants need not install key anti-polluting systems

Jacob Koshy NEW DELHI

The Union Environment Ministry has exempted the majority of India's thermal power plants from installing flue gas desulphurisation (FGD) systems, which are designed to cut sulphur dioxide (SO2) emissions. Flue gas, a residue from burning fuels in thermal power plants, emits SO2, which can mix in the atmosphere and create secondary particulate matter. These are linked to air pollution.

There are about 180 thermal power plants in India and a single plant can have multiple units. Now on, only about 11% of India's 600 thermal power plant (TPP) units have to mandatorily install the FGD systems. These plants, called 'Category A', are the ones located within a 10-km radius of the National Capital Region or cities with a population of at least a million as per the 2011 Census.

Another 11% of TPPs, called Category B - located within 10 km radius of critically polluted areas (CPA) or non-attainment cities (NAC) - may or may not have to install FGD, depending upon the decision by a committee of experts.

The remaining 78% of thermal power plants, or 'Category C', and are now exempt from installing FGD. The updated rules regarding the installation of FGD are in line with the recommendations of an expert committee constituted by Principal Science Adviser Ajay Sood this April. The Hindu had reported on this. Last month, Power Minister Manohar Lal Khattar had said the Central Pollution Control Board was examining this committee's recommendations and would be taking a call on the future of FGD.

The plants in Category A were to have put in place FGD systems by 2017 but have been given extensions to comply. The latest is December 30, 2027.

Category B plants that comply with the EAC norms have a deadline of December 30, 2028, to install the FGD. CPA are regions or industrial clusters that are extremely polluted and deemed so according to a specified criteria by the Central Pollution Control Board (CPCB). NAC there are 131 of them - are those that have the worst air quality and haven't met the National Ambient Air Quality Standards (NAAQS) for at least five years.

Only about 8% of India's TPPs have installed FGD units. The limited number of vendors capable of installing such equipment in India, high installation costs, potential rise in electricity bills have been some of the reasons cited by the Power Ministry for the plants' inability to adhere to previous deadlines.

Anti-polluting system exemption to thermal plants based on proof: Govt

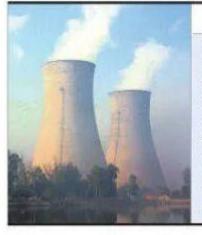

AKSHEEVTHAKUR TRIBUNENEWS SERVICE

NEW DELHI, JULY 14

Days after it was criticised for exempting a large section of the thermal power plants from installing flue gas desulphurisation (FGD) systems, which cut sulphur dioxide emissions, the Union Environment Ministry said its decision represented a "rational and evidence-based recalibration".

The total installed capacity of coal-based thermal power plants in India is approximately 210,969 MW. The coal-based capacity is a significant portion of India's overall power generation capacity, contributing to over 45% of the total. Sulphur dioxide emissions are linked to air pollution.

Citing studies from institutions such as IIT-Delhi, National Institute of Advanced Studies as well as by the National Environmental Engineering Research Institute (NEERI), the environment ministry said current exposure levels provided no credible evidence to suggest that sulphur diox-

ide, under prevailing ambient conditions, is a major public health concern.

A detailed analysis carried out by IIT-Delhi shows that sulfate contributes only 0.96 per cent to 5.21 per cent of particulate matter (PM2.5) and 0.57 per cent to 3.67 per cent of PM10 in cities near thermal power plants. The institute in the study found no significant difference in sulphur dioxide levels between cities with thermal power plants equipped with operational FGDs and those without them.

A study by NEERI also suggested that sulphur dioxide

CITES IIT-DELHI STUDY

Citing studies from IIT-Delhi, National Institute of Advanced Studies as well as by the National Environmental Engineering Research Institute, the environment ministry said current exposure levels provided no credible evidence to suggest that sulphur dioxide, under prevailing ambient conditions, is a major public health concem.

emissions contribute minimally to overall ambient air pollution levels in the form of particulate matter.

There are 180 operational thermal power plants in India and these have 537 units. As per government's official statement in August 2024, only 34 have installed FGD. Now, only about 11 per cent of India's 537 thermal power plant units have to mandatorily install FGD systems.

Congress leader Jairam Ramesh said sulphur dioxide is a health hazard and the ministry's policymaking could be driven by "flawed metrics".

Centre: SO2 norms relaxation misinterpreted

NEW DELHI: The government on Monday defended its recent move to ease sulphur dioxide (SO2) emission norms for thermal power plants, saying the decision was based on detailed scientific studies and stakeholder consultations, and that media reports terming the move a "regulatory dilution" have "grossly misinterpreted" of the notification.

In a statement issued a few days after the July 11 notification that extended deadlines and exempted a large number of coal plants from installing flue gas desulphurisation units, the ministry said, "The media reports misrepresent both the scientific evidence and the environmental policy rationale underlying the revised notification." It said the revised norms were framed after "extensive consultations with stakeholders and research institutions regarding the effectiveness and rationale behind stack emission standards for SO2 on 537 TPPs throughout the country, and its role in overall ambient air pollution of the region".

"Further, the norms were based on detailed scientific studies which were carried out by premier institutions such as IIT Delhi, National Institute of Advanced Studies as well as by the National Environmental Engineering Research Institute (NEERI)-a constituent laboratory of Council of Scientific and Industrial Research (CSIR) besides scientific examination by Central Pollution Control Board," it said. Responding to criticism over

the rollback of deadlines and exemptions for Category C plants, which make up the bulk of India's coal fleet, the ministry said, "The media reports misrepresent both the scientific evidence and the environmental policy rationale underlying the revised notification."

"Contrary to claims of regulato-

The media reports misrepresent both the scientific evidence and the environmental policy rationale underlying the revised notification ry dilution, the ministry's decision represents a rational, evidence-based recalibration anchored in current ambient air quality data, sectoral emission trends and broader sustainability imperatives," it said.

The ministry also rejected suggestions that the National Ambient Air Quality Standards (NAAQS) for SO2, last revised in 2009, are outdated. "The contention that the existing SO2 NAAQS, last updated in 2009, are obsolete simply due to their age is scientifically unfounded, " it said.

"In fact, any revision to SO2 standards must be driven by its actual contribution to PM2.5 levels and its corresponding health burden, rather than rhetorical assertions," the ministry added.

FGD rule relaxation to cut electricity cost by 25-30 paise a unit

PTI

NEW DELHI

The government's move to ease sulphur emission rules for most coal-fired power plants strikes a delicate balance between costs, climate and compliance and is expected to cut electricity costs by 25-30 paise per unit, officials said on Sunday.

In a gazette notification, the government has restricted the 2015 mandate of installing fluegas desulphurisation (FGD) systems that remove sulphur from a power plants' exhaust gases, only to plants located within 10 kilometres of cities with a population exceeding one million.

Plants in critically polluted areas or non-attainment cities will be evaluated on a case-bycase basis while all other plants - accounting for nearly 79% of India's thermal power capacity - are exempt from mandatory FGD installation. The notification stated that the decision was made following a detailed analysis by the Central Pollution Control Board, which found increased carbon dioxide emissions resulting from the operation of existing control measures. Industry officials said this would lead to differentiated compliance based on proximity to urban populations and the sulphur content of the coal used. The new framework has been finalised after extensive deliberations and multiple independent studies. Millenniumpost • 14 Jul • Adani Group • Adani Power Ltd. India's FGD shift echoes global reform in climate rules

Revision is likely to cut power generation costs by up to Rs 0.30/kilowatt hour. offering direct benefit to consumers

OUR CORRESPONDENT

NEW DELHI: India's decision to relax its mandate on flue gas desulphurisation (FGD) systems at coal-fired power plants is being viewed internationally not as environmental regression, but as a shift toward more nuanced and evidence-led regulation. The move aligns with broader global trends, where countries are increasingly tailoring emissions policies to local conditions and life-cycle climate considerations.

The Ministry of Environment, Forest and Climate Change (MoEF&CC)

announced that FGD systems, which remove sulphur dioxide (SO2) from flue gases, will now be mandatory only for plants near dense urban zones or in critical pollution areas. Roughly 80 per cent of India's installed coal capacity, most of it running on low-sulphur domestic coal, will be exempt.

The decision follows indeendent assessments by three Indian research institutions, which concluded that ambient SO2 levels are well within national standards even in regions without FGDs. Meanwhile, full-scale retrofitting

Closer Look

- » FGD systems, which remove sulphur dioxide (SO₂) from flue gases, will now be mandatory only for plants near dense urban zones or in critical pollution areas.
- » Roughly 80% of India's installed coal capacity, most of it running on low-sulphur domestic coal, will be exempt
- India is not alone. The US, Europe and China all of which pioneered FGD rollouts in earlier decades -

was projected to increase CO2 emissions by nearly 70 million tonnes over five years, largely due to added limestone mining and auxiliary energy use. The revision is also expected

have since shifted toward differentiated enforcement to reduce power generation costs by Rs 0.25 - Rs 0.30 per kilowatt hour, offering a direct benefit to consumers and easing pressure on India's cashstrapped power distribution companies. Industry experts have described the move as "regulatory realism" that will preserve affordability without compromising core environmental goals.

India is not alone. The US, Europe and China -- all of which pioneered FGD rollouts in earlier decades - have since shifted toward differentiated enforcement and performance-based compliance. China, after an aggressive FGD deployment from 2004 to 2012, now applies zonal standards and is placing more emphasis on PM2.5 reduction and system-level efficiency.

Critics continue to argue that any relaxation risks delaying clean air goals.

But those in government insist that the new framework targets pollution where it matters most and frees up billions in capital for higher-impact interventions such as electrostatic precipitators, real-time monitoring and renewable grid upgrades.

For many developing conomies still reliant on coal, India's recalibration may serve as a practical template - ambitious where necessary, economical where possible and always informed by data.

Jairam Ramesh slams govt after it eases SO2 emission norms

OUR CORRESPONDENT

Highlights

NEW DELHI: With the government exempting about 78 cent per cent of coal-fired plants from installing key antipolluting systems, Congress leader Jairam Ramesh on Sunday said the Environment Ministry's rationale for the policy is based on "faulty premises".

He asserted that the government's policymaking will continue to be driven by "flawed metrics" in the absence of the National Ambient Air Quality Standards (NAAQS) revision.

The former environment minister attacked the government after the central government once again extended the deadline for coal-based thermal power plants to comply with sulphur dioxide emission norms and fully exempted those located away from critically polluted areas or cities with a population of over one million.

"The Modi Government has already achieved the dubious distinction of having made India the global leader in sulphur dioxide emissions. Now we learn that the Environment Ministry has exempted 78-89% of India's thermal power plants from installing flue gas desulphurisation (FGD) systems that cut sulphur dioxide emissions," Ramesh said in a post on X.

This is after the deadline for installing FGD systems, initially slated for 2017, was repeatedly pushed, the Congress general secretary said.

Sulphur dioxide is a direct

» He asserted that the government's policy making will continue to be driven by "flawed metrics" in the absence of the National Ambient Air Quality Standards (NAAQS) revision

» Sulphur dioxide is a direct threat to public health and has also been known to impact cloud

threat to public health and has also been known to impact cloud formation, disrupting the monsoon that is the lifeline of the Indian economy, Ramesh said.

"More damagingly, research has increasingly shown that a large part of India's ambient PM2.5 (fine particulate matter of diameter less than 2.5 mm) is attributable to secondary particulate matter formed when sulphur dioxide reacts with other compounds," he said.

Estimates suggest that anywhere between 12 per cent to 30 per cent of PM2.5 is attributable to such sulphur dioxide compounds, he said.

"The Ministry's rationale for this policy is based on two faulty premises. The Ministry had earlier amended the focus of the National Clean Air Program (NCAP) to focus largely on PM10 emissions (particulate matter of less than 10mm diameter).

"PM10 is a lot less dan-

formation, disrupting the monsoon that is the lifeline of the Indian economy, Ramesh said

gerous to human health than PM2.5 but is more obviously visible and somewhat easier to tackle, since it includes elements such as road dust." he said.

By choosing to turn a blind eye towards PM2.5 in its policymaking, the ministry has consigned us to many years more of our ongoing public health crisis – and this decision to tolerate sulphur dioxide compounds is only set to exacerbate this trend, he said.

"The Ministry claims that sulphur dioxide levels in India are largely within the limits of the National Ambient Air Quality Standards (NAAQS). As we have repeatedly pointed out, the NAAQS were last updated in 2009, when the prevailing levels of particulate matter and emissions were of a decidedly lower order of magnitude, and when the catastrophic public health consequences of particulate matter were not known, Ramesh said.

Government eases sulphur dioxide emission norms, exempts large number of coal plants

OUR CORRESPONDENT

NEW DELHI: The central government has once again extended the deadline for coalbased thermal power plants to comply with sulphur dioxide emission norms and has fully exempted those located away from critically polluted areas or cities with a population of over one million.

In a notification dated July 11, the environment ministry said the compliance deadline for Category A plants, located within a 10-km radius of the National Capital Region or cities with a population of over one million, has been extended from December 2024 to December 2027.

Category B plants, situated within a 10-km radius of critically polluted areas or non-

attainment cities, will now be assessed on a case-by-case basis instead of adhering to the earlier 2025 deadline. Category C plants -- all others not falling under Category A or B -- have been completely exempted from the sulphur dioxide norms, provided they meet the prescribed stack height criteria. These plants were earlier required to comply by December 2026.

Flue gas desulphurization units are installed in coal-fired power plants to control sulphur dioxide emissions, a major air pollutant. SO2 converts into fine particulate matter (PM2.5), which can penetrate deep into the lungs and cause a range of diseases, leading to millions of deaths each year.

The ministry said it had received numerous representations seeking exemption or relaxation in the timelines of the emission standards due to factors such as the "limited availability of technology providers, its techno-economic feasibility, negative impact of the Covid pandemic on supply chain, price escalation due to high demand and low supplies, low Sulphur dioxide concentration in ambient air and heavy burden on consumer due to increase in electricity prices etc".

It added that it had also received an "explicit recommendation" from the Ministry of Power in this regard. According to the notification, several studies were conducted by research institutions regarding the effectiveness and rationale behind the SO2 standards and their role in the overall ambient air pollution of the region.

The ministry said consultations were held with the industry, the Ministry of Power, the Central Pollution Control Board (CPCB), scientific institutions and other stakeholders regarding the emission standards and their timeline.

It added that a committee was constituted in the CPCB to "examine the issue in totality, assess the available study reports, other relevant materials and other related factors and make a recommendation on applicability of these standards and its timeline".

Centre eases FGD norms for power plants, electricity costs to come down

NEW DELHI, JUL 13

HE Ministry of Environment, Forest and Climate Change has relaxed the requirement for mandatory installation of flue gas desulphurisation (FGD) systems at most coalbased thermal power plants, marking a move towards differentiated compliance based on proximity to urban populations and the sulphur content of the coal used.

The new framework, finalised after extensive deliberations and multiple independent studies, will restrict FGD mandates only to plants located within 10 kilometres of cities with a population exceeding one million.

Plants in critically polluted areas or non-attainment cities will be evaluated on a case-by-case basis. All other plants accounting for nearly 79 per cent of India's thermal power capacity - are now exempted from mandatory FGD installation.

Crucially, the relaxed norms are expected to bring down the cost of electricity by 25 to 30 paise per unit. That benefit, say experts, will ultimately flow to cona high-In sumers. demand, cost-sensitive economy, the impact could be significant, helping state discoms contain tariffs and reducing the subsidy burden on governments.

The financial burden of mandatory FGD retrofitting was previously estimated at over Rs 2.5 lakh crore, or Rs 1.2 crore per MW, with installation timelines of up to 45 days per unit. Several power producers had warned that this would not only raise costs but also jeopardise grid stability during peak seasons.

The decision follows a series of studies by IIT Delhi, CSIR-NEERI and the National Institute of Advanced Studies (NIAS), which found that ambient sulphur dioxide levels in most parts of India are well within the National Ambient Air Standards Ouality (NAAQS). Measurements across multiple cities showed sulphur dioxide levels ranging between 3 and 20 µg/m3, significantly below the NAAQS threshold of 80 µg/m³.

The studies also questioned the environmental and economic efficacy of a universal FGD mandate in the Indian context. Indian coal typically has a sulphur content of less than 0.5 per cent, and due to high stack heights and favourable meteorological conditions, dispersion of sulphur dioxide is efficient.

The NIAS study warned that retrofitting FGDs nationwide would add an estimated 69 million tonnes of carbon dioxide emissions between 2025 and 2030 due to increased limestone mining, transportation, and power consumption.

FGDs are useful in places with high sulphur coal (like in China or the US), high ambient sulphur dioxide levels and dense urban proximity. Studies show that India does not face these problems at scale, making universal FGD rollout unnecessary, expensive and counterproductive.

Industry executives welcomed the decision. "This is a rational, sciencebased move that avoids unnecessary costs and focuses regulation where it is most needed," said a senior executive at a leading public sector utility. "More importantly, it will help keep electricity affordable."

Officials stressed that the government remains committed to environmental protection, but with a smarter lens. "This is not a rollback. It is a recalibration based on evidence," a senior official said.

"Our approach is now targeted, efficient and climate-conscious," the official added.

An affidavit incorporating these findings will be submitted shortly to the Supreme Court in the MC Mehta vs Union of India case, where FGD enforcement timelines have been under judicial scrutiny.-IANS

CENTRE RELAXES FGD RULE, ELECTRICITY COST TO REDUCE BY 25-30 PAISE A UNIT

TDG NETWORK NEW DELHI

The government's move to ease sulphur emission rules for most coal-fired power plants strikes a delicate balance between costs, climate and compliance and is expected to cut electricity costs by 25-30 paise per unit, officials said on Sunday.

In a gazette notification, the government has restricted the 2015 mandate of installing flue-gas desulphurisation (FGD) systems that remove sulphur from a power plants' exhaust gases, only to plants located within 10 kilometres of cities with a population exceeding one million.

Plants in critically polluted areas or non-attainment cities will be evaluated on a case-by-case basis while all other plants -- accounting for nearly 79 per cent of India's thermal power capacity -- are exempt from mandatory FGD installation.

The notification stated that the decision was made following a detailed analysis by the Central Pollution

Control Board, which found increased carbon dioxide emissions resulting from the operation of existing control measures.

Industry officials said this would lead to differentiated compliance based on proximity to urban populations and the sulphur content of the coal used.

The new framework has been finalised after extensive deliberations and multiple independent studies. The decision follows a series of studies by IIT Delhi, CSIR-NEERI and the National Institute of Advanced Studies (NIAS), which found that ambient sulphur dioxide levels in most parts of India are well within the National Ambient Air Quality Standards (NAAQS).

Measurements across multiple cities showed sulphur oxide levels ranging between 3 and 20 micrograms per cubic meter, significantly below the NAAQS threshold of 80 micrograms per cubic meter. Officials said studies had also questioned the environmental and economic efficacy of a universal FGD mandate in the Indian context. Indian coal typically has a sulphur content of less than 0.5 per cent, and due to high stack heights and favourable meteorological conditions, dispersion of SO2 is efficient.

The NIAS study warned that retrofitting FGDs nationwide would add an estimated 69 million tonnes of CO2 emissions between 2025 and 2030 due to increased limestone mining, transportation, and power consumption.

Industry officials said the relaxed norms are expected to bring down the cost of electricity by 25-30 paise per unit. That benefit, they said, will ultimately flow to consumers.

In a high-demand, costsensitive economy, the impact could be significant -- helping state discoms contain tariffs and reducing the subsidy burden on governments. The financial burden of mandatory FGD retrofitting was previously estimated at over Rs 2.5 lakh crore, or Rs 1.2 crore per MW, with installation timelines of up to 45 days per unit. Several power producers had warned that this would not only raise costs but also jeopardise grid stability during peak seasons.

Industry executives welcomed the decision. "This is a rational, science-based move that avoids unnecessary costs and focuses regulation where it is most needed," said a senior executive at a leading public sector utility. "More importantly, it will help keep electricity affordable."

Officials stressed that the government remains committed to environmental protection, but with a smarter lens. "This is not a rollback. It is a recalibration based on evidence," said a senior government official. "Our approach is now targeted, efficient and climateconscious."

An affidavit incorporating these findings will be submitted shortly to the Supreme Court in the MC Mehta vs Union of India case, where FGD enforcement timelines have been under judicial scrutiny.

ICP Keshari, Director General of Power Producers Association (PPA), hailed the decision as "good and consumer-centric".

The move will benefit power plants based on domestic coal, he said. Indian coal, he said, does not have any big sulfur oxides (SOx) emission problem and it is only the particulate matter, which is of concern.

Electricity may cost less as FGD norms eased

Cost may come down by 25-30 paise per unit

NEW DELHI

The Ministry of Environment, Forest and Climate Change has relaxed the requirement for mandatory installation of flue gas desulphurisation (FGD) systems at most coal-based thermal power plants, marking a move towards differentiated compliance based on proximity to urban populations and the sulphur content of the coal used.

The new framework, finalised after extensive deliberations and multiple independent studies, will restrict FGD mandates only to plants located within 10 kilometres of cities with a population exceeding one million.

Plants in critically polluted areas or non-attainment cities will be evaluated on a case-by-case basis. All other plants - accounting for nearly 79 per cent of India's thermal power capacity -are now exempted from mandatory FGD installation.

Crucially, the relaxed norms are expected to bring down the cost of electricity by 25 to 30 paise per unit. That benefit, say experts, will ultimately flow to consumers. In a high-demand, cost-sensitive economy, the impact could be significant, helping state discoms contain tariffs and reducing the subsidy burden on governments.

The financial burden of mandatory FGD retrofitting was previously estimated at over Rs 2.5 lakh crore, or Rs 1.2 crore per MW, with installation timelines of up to 45 days per unit. Several

power producers had warned that this would not only raise costs but also jeopardise grid stability during peak seasons.

The decision follows a series of studies by IIT Delhi, CSIR-NEERI and the National Institute of Advanced Studies (NIAS), which found that ambient sulphur dioxide levels in most parts of India are well within the National Ambient Air Quality Standards (NAAQS).

Measurements across multiple cities showed sulphur dioxide levels ranging between 3 and 20 (micrograms per cubic meter air), significantly below the NAAQS threshold of 80 (micrograms per cubic meter air). The studies also questioned the environmental and economic efficacy of a universal FGD mandate in the Indian context.

Indian coal typically has a sulphur content of less than 0.5 per cent, and due to high stack heights and favourable meteorological conditions, dispersion of sulphur dioxide is efficient. The NIAS study warned that retrofitting FGDs nationwide

would add an estimated 69 million tonnes of carbon dioxide emissions between 2025 and 2030 due to increased limestone mining, transportation, and power consumption. FGDs are useful in places with high sulphur coal (like in China or the US), high ambient sulphur dioxide levels and dense urban proximity. Studies show that India does not face these problems at scale, making universal FGD rollout unnecesexpensive sary. and counterproductive.

Industry executives welcomed the decision. "This is a rational, science-based move that avoids unnecessary costs and focuses regulation where it is most needed," said a senior executive at a leading public sec-tor utility. "More impor-tantly, it will help keep electricity affordable.

Officials stressed that the government remains committed to environmental protection, but with a smarter lens. "This is not a rollback. It is a recalibration based on evidence," a senior official said. LANS

बिजली की लागत में 25-30 पैसे प्रति यूनिट की कमी

नयी दिल्ली। अधिकांश कोयला आधारित बिजली संयंत्रों के लिए सल्फर उत्सर्जन नियमों में ढील देने का सरकार का फैसला लागत, जलवायु और अनुपालन के बीच एक नाजुक संतुलन बनाता है। अधिकारियों ने रविवार को यह जानकारी देते हुए कहा कि इससे बिजली की लागत में 25-30 पैसे प्रति यूनिट की कमी आने की उम्मीद है। एक सरकारी अधिसूचना के अनुसार सरकार ने बिजली संयंत्रों से निकलने वाली गैसों से सल्फर हटाने वाली फ्लू-गैस डिसल्फराइजेशन (एफजीडी) प्रणालियां स्थापित करने के नियमों में राहत दी है। वर्ष 2015 के इस आदेश को अब केवल दस लाख से अधिक आबादी वाले शहरों के 10 किलोमीटर के दायरे में स्थित संयंत्रों तक सीमित कर दिया गया है। गंभीर रूप से प्रदूषित क्षेत्रों में स्थित संयंत्रों का मूल्यांकन हर मामले के आधार अलग-अलग किया जाएगा।

केंद्र सरकार ने कोयला बिजली संयंत्रों के लिए सल्फर उत्सर्जन नियमों में दी ढील

नई दिल्ली। केंद्र सरकार ने एक दशक पुराना आदेश को पलटते हुए कोयले से बिजली बनाने वाले संयंत्रों के लिए सल्फर उत्सर्जन नियमों में ढील दे दी है। 11 जुलाई को पर्यावरण मंत्रालय की तरफ से जारी अधिसूचना के अनुसार 79 प्रतिशत संयंत्रों को फ्लू-गैस डिसल्फराइजेशन (एफजीडी)

सिस्टम लगाने से छूट दी गई है। ये ऐसे संयंत्र हैं जो प्रदूषण के हॉटस्पॉट से 10 किलोमीटर से ज्यादा दुर स्थित हैं।

कोयला बिजली संयंत्र के लिए एक दशक पुराना आदेश पलटा

एक अधिकारी ने बताया कि

कोयला आधारित बिजली संयंत्रों के लिए सल्फर उत्सर्जन नियमों में ढील देने से बिजली की कीमत में 25-30 पैसे प्रति यूनिट की कमी आने की उम्मीद है। सरकार के आदेश के अनुसार बाकी 11 प्रतिशत संयंत्रों की मामले-दर-मामला समीक्षा की जाएगी, जबकि 10 प्रतिशत संयंत्र जो दिल्ली और दूसरे बड़े शहरों के करीब हैं, उन्हें दिसंबर 2027 तक आदेश का पालन करना होगा। वहीं, कांग्रेस नेता जयराम रमेश ने केंद्र सरकार की ओर से सल्फर डाइऑक्साइड उत्सर्जन के नियमों में छूट देने को गलत बताया। उन्होंने सरकार के इस कदम को पर्यावरण के लिए खतरा बताया है। ब्यूरो

costs to come down

IANS New Delhi

Business Remedies. The Ministry of Environment, Forest and Climate Change has relaxed the requirement for mandatory installation of flue gas desulphurisation (FGD) systems at most coalbased thermal power plants, marking a move towards differentiated compliance based on proximity to urban populations and the sulphur content of the coal used.

The new framework, finalised after extensive deliberations and multiple independent studies, will restrict FGD mandates only to plants located within 10 kilometres of cities with a population exceeding one million. Plants in critically polluted areas or non-attainment cities will be evaluated on a case-by-case basis. All other plants - accounting for nearly 79 per cent of India's thermal power capacity - are now exempted from mandatory FGD installation.

Crucially, the relaxed norms are expected to bring down the cost of electricity by 25 to 30 paise per unit. That benefit, say experts, will ultimately flow to consumers. In a high-demand, cost-sensitive economy, the impact could be significant, helping state discoms contain tariffs and reducing the subsidy burden on governments.

The financial burden of mandatory FGD retrofitting was previously estimated at over Rs 2.5 lakh crore, or Rs 1.2 crore per MW, with installation timelines of up to 45 days per unit. Several power producers had warned that this would not only raise costs but also jeopardise grid stability during peak seasons.

The decision follows a series of studies by IIT Delhi, CSIR-NEERI and the National Institute of Advanced Studies (NIAS), which found that ambient sulphur dioxide levels in most parts of India are well within the National Ambient Air Quality Standards (NAAQS). Measurements across multiple cities showed sulphur dioxide levels ranging between 3 and 20 µg/m3, significantly below the NAAQS threshold of 80 µg/m3. The studies also questioned the environmental and economic efficacy of a universal FGD mandate in the Indian context.

वीज खर्चात २५-३० पैसे प्रति युनिट कपातीसाठी नियमात बदल

उत्सर्जन नियम करण्याच्या निर्णयामुळे प्रति युनिट वीज खर्च अधिसूचनेत म्हटले आहे. २५-३० पैशांनी कमी होण्याची अपेक्षा आहे, असे अधिकाऱ्यांनी मंडळाच्या रविवारी सांगितले. सरकारने विश्लेषणानंतर हा निर्णय घेण्यात वीज प्रकल्पांच्या 'एक्झॉस्ट' आला. त्यामध्ये वायूंमधून 'सल्फर' काढून नियंत्रण टाकणाऱ्या डिसल्फरायझेशन (एफजीडी) डायऑक्साइड उत्सर्जनात वाढ प्रणाली बसवण्याच्या २०१५ च्या झाल्याचे आढळून आले.

नवी दिल्ली : बहुतांश आदेशाला केवळ दहा लाखांपेक्षा कोळशावर चालणाऱ्या वीज जास्त लोकसंख्या असलेल्या प्रकल्पांसाठी सल्फर (गंधक) शहरांच्या १० किलोमीटरच्या आत शिथिल असलेल्या प्रकल्पांपुरते मर्यादित सरकारच्या केले आहे, असे एका राजपत्रित
